Follow Us/      

Patch management has been made even easier with onQloud RMM 1.5 thanks to a new RMM policy for Windows updates.

In addition to automating patch installations and setting update schedules, it is now possible to exclude unwanted updates, postpone patch installation, and specify when to reboot the remote computer. An RMM policy configured for a specific company will be automatically applied to every new computer added to that company, ensuring that Windows updates are installed automatically.

- **Automated updates:** Our RMM Policy automates the process of checking for and installing Windows updates, saving you time and reducing the risk of errors.
- **Improved security:** By ensuring that your Windows systems are always up to date, our RMM Policy helps keep your business secure from potential cyber threats.
- **Increased productivity:** Outdated software can slow down your systems and impact productivity. With our RMM Policy, you can ensure that your Windows systems are always running smoothly and efficiently.
- **Cost savings:** By preventing issues caused by outdated software, our RMM Policy can help you save money on costly repairs and downtime.

We can't wait to show how it will work.
