

# Maximize Your Productivity with onQloud RMM

## Scheduled Tasks: Automate Routine Maintenance and Troubleshooting

onQloud RMM (Remote Monitoring and Management) is a powerful tool for managing and maintaining multiple devices remotely. One of the key features of onQloud RMM is the ability to schedule tasks to run on specific devices at specific times. This allows you to automate routine maintenance and troubleshooting tasks, saving you time and effort.

One of the most common uses of scheduled tasks in onQloud RMM is to run software updates on all devices on a regular basis. This ensures that all devices are running the latest version of the software and are protected against security vulnerabilities. You can also use scheduled tasks to run scripts that can automate troubleshooting and repair tasks, such as checking for disk errors or clearing temp files.

Another great feature of onQloud RMM scheduled tasks is the ability to run tasks on specific devices or groups of devices. This allows you to target specific devices that may be experiencing issues, without affecting the rest of your network. For example, you can schedule a task to run a disk cleanup on all devices in a specific location, without affecting devices in other locations.

Scheduling tasks in onQloud RMM is easy and straightforward. Once you have created a task, you can set the schedule to run it on a specific date and time, or on a recurring basis. You can also set the task to run only when certain conditions are met, such as when the device is idle or when the device is connected to the internet.

In conclusion, onQloud RMM scheduled tasks are a powerful and essential feature for managing and maintaining your devices remotely. It allows you to automate routine maintenance and troubleshooting tasks, saving you time and effort, while ensuring that all devices are running smoothly and securely. With onQloud RMM, you can easily schedule

tasks to run on specific devices at specific times, giving you more control and visibility over your network.
